Abstract

The present invention provides a developing method and a developing unit which can obtain a favorable image quality and the like even when a surface roughness Rz of a developing sleeve is changed or when an amorphous-silicon photoconductor is used by allowing the magnetic monocomponent toner to effectively jump to a photoconductor from a developing sleeve. To attain such an object, the present invention provides a magnetic monocomponent jumping developing system and a developing unit which uses the method, wherein as the magnetic monocomponent toner, a toner having a volume center particle size which is calculated from the particle size distribution based on volume and falls within a range from 6.0 to 7.8 \mu m, having the sphericity which falls within a range from 0.92 to 0.98, and setting a toner quantity having a volume particle size of $5.04\mu m$ or less to a value which falls within a range from 2.5to 10.0 volume% is used and, at the same time, assuming a toner quantity per unit area of the toner image as A, a following relationship formula (1) is satisfied.

$$0.6 \text{mg/cm}^2 \leq A \leq 0.9 \text{mg/cm}^2 \tag{1}$$
